Is there code in TSB (besides "JUICE") that makes COM defense cover more WRs as the season progresses/MAN gets more wins?

It seems to me that either:

1. there is some "extra code" that makes COM cover more WR as season goes on,
2. or COM is picking the best possible pass play to get max coverage as the season progresses

I've tried setting a high "INT Juice" for every week and that doesn't do it. Even with all the same "INT Juice" the coverage still increases as I get more wins...[And I don't want to hack the defensive play bytes because I don't want to interfere with MAN side of the ball.]

I want to make only COM cover more WRs all the time and it seems to me that there is something happening to make them cover more later in a season. But I don't understand how it works.

It's like an overall COM "aggressiveness" factor. It would be nice to turn this up sooner in a season.

I did a little searching last night but couldn't find it. I was looking for code that loaded up at the start of the game - similar to "juice" code - it's loaded at the beginning of the game. I

wasn't able to find any values that loaded in a similar pattern, except stuff around xE07C. Does anybody know what is going on around xE07C to xE0AB? I'm going to look for code that's loaded when COM defense gets on the field, hopefully I can find a pattern...we've got to find this COM "mojo"!

✓ buck said:

Does anybody know what is going on around xE07C to xE0AB?

that has something to do with the "week 1-17" text that displays at the intro to a season game.

just a bump here, but I'm still pretty darn sure that there is some other kind of cpu mojo goin' on as the season progresses...I'm not sure how to find it, though.  
any ideas on how to use fceuxdsp or something?

If I knew the answer to this, I'd be super happy. I did some searching myself, but I couldn't find it either...

Specifically, I'd like this for the SNES, although I assume once we find it in the NES, it'd be easy to port.

I think I may have found it:

This code is ran at the start of the game...I think it also sets the juice.

```
; 0x034106
$80F6:A0 B2 LDY #$B2           ;
$80F8:B1 3E LDA ($3E), Y      ; wins
$80FA:A0 B3 LDY #$B3           ;
$80FC:38 SEC                  ;
$80FD:F1 3E SBC ($3E), Y      ; losses
$80FF:B0 10 BCS $8111          ; if (wins - losses >= 0) goto $
$8101:4C 0F 81 JMP $810F
$8104:20 58 81 JSR $8158
$8107:C9 30 CMP #$30
$8109:F0 04 BEQ $810F
$810B:C9 03 CMP #$03
$810D:D0 2D BNE $813C
$810F:A9 00 LDA #$00          ; else, set difference to zero
$8111:8D 7D 66 STA $667D      ; save difference
```

When the ball is snapped this code is ran:

```
; 0x028B3F
```

```
$8B2F:AD 7D 66 LDA $667D      ;
$8B32:C5 DE   CMP $DE
$8B34:90 03 BCC $8B39
$8B36:4C C5 97 JMP $97C5      ; <---harder ai
$8B39:4C 1B 80 JMP $801B      ; <---softer ai
```

By NOP'ing the **BCC \$8B39** out, the CBs almost always covered the receivers, the ILBs either double covered/ran back and forth between 2 receivers/rushed the qb. When I NOP'ed the **JMP \$97C5** too, the defense usually just stood there.  
I need to test it out a bit more (I only tried season, MAN vs COM, MIN vs DET).

yeah, in preseason mode -> setting 0x28b44 and 0x28b45 to EA seems to give the cpu late-season AI - even in RUN defense...hot damn.

any chance you could find the SNES location, cx? I looked for a similar string and couldn't find one...

I wonder how this works...does it use the value that's there until your record gets to a certain point, and then it flips this flag to no operation? Basically...if the game detects nop in this location, it's good coverage, otherwise it's preseason style coverage?

Now that I started teaching myself 6502, I understand a bit more what's going on...so the reason I couldn't find the string is because the CMP and the JMPs are pointing to memory locations, and those are likely different in the SNES. I was able to find 90 03 4C in about a million spots, now I just need to find one near a C5

why don't you search for "C5 DE 90 03 4C"

I searched for it and can't find it

I think the DE is not in the snes. I think I found it as I said in the last post, XVI32 has a wildcard character search. I will test tonight.

If this does work, I think the juice code for interceptions should be altered, as it might be near impossible to pass.

Yeah, I'm playing thru a season right now with this MOJO hack...get your JJs and timed-Dive catches in order!

I'm gonna look into a random branch...so at least there's a chance that you can get somebody besides a HB or TE open.

The \$DE is a ram address, so it probably won't be the same on the snes. If it doesn't turn up, I can take a look tonight when I get home.

What I usually do is set a breakpoint in the debugger on the address I'm trying to find. When it snaps, right click on the left side of the debugger window and some text should pop up that says "go here in rom" or something like that.

Buck, that random thing is intriguing. Let me know what you find.  
cxrom, thanks for the response. Once I looked at the code, I realized the DE was a memory address. If my tests don't pan out, I might have to consult with you. Thanks much.

Unless my eyes deceive me, that is definitely it for SNES. Everyone was covered a helluva lot more often and I had to get lucky enough to have a guy wide open or hope for a diving CC...very cool.  
Now if we could come up with some way to make it a little more randomized so it wasn't so darned difficult...running was effin' impossible with this turned on...

improved AI which would make the attributes actually matter instead of playing against a team of madmen.

But anyways... great find!! I've always wondered where that boost came from I'm glad it's finally been found.

Now if only someone could figure out how to have the cpu randomly pick a player and then give the guy with the # over his head a boost I'd have my wishlist just about complete.

$8B2F:AD 7D 66 LDA $667D      ;
$8B32:C5 DE    CMP $DE
$8B34:90 03 BCC $8B39
$8B36:4C C5 97 JMP $97C5      ; <--harder ai
$8B39:4C 1B 80 JMP $801B      ; <--softer ai
```

Interesting, I never looked hard for this since I didn't think it existed. But I wanted to know what \$DE was and I had a pretty good idea from doing the play coding.

From my play design post:

xC8 = COM Jump To (Pointer, Random). \$DE = Random in the C8 command while \$667D = Juice Level

This code isn't exactly doing harder AI and softer AI. It is deciding whether to jump to the Pointer (\$97C5) or skip the Pointer (\$801B). Just in the original game the C8 commands are better for obvious reasons now explained.

Quote

So is this just a binary situation, either C8 or no C8? Is there a way to "soften" this or make it randomly occur on a play-by-play basis?

...maybe jump to a created subroutine which basically flips a coin and either jumps to \$97C5 or doesn't?

Buck, it works like this:

RILB BC93:

```
SetBall, E0, 18, 2pt,  
CPURandom, $B9E6, 06,  
Jump, $AFDF //
```

I broke this down a bit but CPURandom = C8 command. Location \$B9E6 does a random chance at m2m FB, WR1, or TE. Location \$AFDF does a small move, pause for a time period, then pass rush.

\$DC, \$DD, \$DE are used by the play design. In the CPURandom above: \$DC = xE6, \$DD = xB9, \$DE = x06. In the code cxrom posted: Location \$97C5 makes the player's current play location = \$B9E6 and Location \$801B makes the player's current play location = the Jump above (skipping the pointer).

So if the Juice Level < x06, the RILB will pause then pass rush but if the Juice Level >= x06 the RILB will m2m either the FB, WR1, or TE.

Basically, you could adjust C8 levels or add in C8 commands to make the CPU do various things based upon the juice level.

jstout,

I was referring to creating a subroutine (called at \$8B34) that decides on a random chance that "\$8B36:4C C5 97 JMP \$97C5 ; <--harder ai" would even be executed. Because, dropping EA EA in for the "\$8B34:90 03 BCC \$8B39" gives good coverage - all the time.

Here's what stout gave me:

;The NES 0x028B3F

\$8B2F:AD 7D 66 LDA \$667D ; Team Juice Level

\$8B32:C5 DE CMP \$DE ; Player Juice Level

\$8B34:90 03 BCC \$8B39

\$8B36:4C C5 97 JMP \$97C5 ; If Team Juice Level >= Player Juice Level

\$8B39:4C 1B 80 JMP \$801B ; If Team Juice Level < Player Juice Level

For a straight %:

LDA \$3D ; Random Number - \$3B or \$3C also would work

CMP #\$80 ; 50% for each (can adjust for different%)

BCC :+

JMP \$97C5

: JMP \$801B

For Player Juice Level making %:

LDA \$3D ; Random Number - \$3B or \$3C also would work

AND #\$0F ; Range of 0-15

CMP \$DE ; Player Juice Level

BCC :+

JMP \$97C5

: JMP \$801B

I've not played around with it yet, but I plan to soon...

Here's the set patch for SNES:

SET(0x19519,0x5cada680ea)

SET(0x26AD,0xad0202c9**80**90045c06a5835c428883)

x80 in red signifies the cutoff point between two halves of the allowable random number values 0-255 (x00 - xFF). The code takes a random number and checks if it's in the first half or the second half of those values. If it's in the upper half, it uses hardcore coverage, otherwise it uses limp noodle coverage. since x80 = 127, or halfway between the allowable values, the probability is 50% either way. You can replace that x80 with anything from x00 - xFF. The lower the number, the more often you'll see hardcore coverage.

Sidenote:

This was my first attempt at writing my own patch while attempting to teach myself assembly and rom hacking on an advanced level. I wasn't able to do it 100% by myself yet, as there were surprises I did not foresee, even for a simple patch such as this, but jstout has been graciously answering questions, providing lengthy informative answers, and guiding me along. Many MANY thanks to him for this. One day I hope to be as useful with the stuff as he is. Honestly, assembly wasn't that hard to pick up once I found a good "6502 for dummies" tutorial (see [this link](#) if you're interested, it's really simple and easy to follow). The harder part is finding out all the intricacies of how roms are laid out, banks of memory, pages, loROM, hiROM, etc...the road ahead is long, but I'm determined to get there.

Most excellent. I have not the time nor interest to delve this deeply/specifically into the world of ROM-hacking, although I have profound respect for those who are/do, so I'm happy more of us are committed to that type of TSB journey. I wish you merry times of discovery!

You must have delved somewhat deep for what you did with TSC. Either way, it's been super fun (and effin' frustrating thus far), but thanks for the merry wishes.

"Tis the season to be Merry."

"Well that's my name."

"No shit?"

Only enough to be able to affect the top-layer on-screen results. The kind of schooling it takes to do what CX\_ROM and Jstout do with the game (content building) takes more patience with learning formula and data than my generally right-sided brain is able to process. I give generous amounts of daps to those so inclined.

How does the instruction: LDA \$3D generate a random number?

[Quote](#)**TecmoTurd**

Tecmo Legend

Members

Posted September 4, 2009

[Report post](#)

It doesn't, it loads the value at address \$3D into the accumulator. \$3B, \$3C, and \$3D change every 1/60 seconds and can be a value of x00 - xFF. This is for the NES, though. The SNES has these at different spots, but same concept.

Gotcha. Thanks. I'm trying to reprogram the OL vs DL to the percentages I want. I could do it in the individual play code but its very cumbersome.

I was thinking of testing out the ratio of covered plays later in the season in order to pick a better number for the coverage patch for earlier in the season. That way it plays a lot like it would if you were juiced late in the season. I will do this because right now it's a way too hard to run.

yeah, in preseason mode -> setting 0x28b44 and 0x28b45 to EA seems to give the cpu late-season AI - even in RUN defense...hot damn.

Would anything less change the coverage or does it have to be EA? thanks

It has to be 'EA' at that spot. There are no variations.

However, this is from a Tecmo Turd post above:

;The NES 0x028B3F

\$8B2F:AD 7D 66 LDA \$667D ; Team Juice Level

\$8B32:C5 DE CMP \$DE ; Player Juice Level

\$8B34:90 03 BCC \$8B39

\$8B36:4C C5 97 JMP \$97C5 ; If Team Juice Level >= Player Juice Level

\$8B39:4C 1B 80 JMP \$801B ; If Team Juice Level < Player Juice Level

For a straight %:

LDA \$3D ; Random Number - \$3B or \$3C also would work

CMP #\\$80 ; 50% for each (can adjust for different%)

BCC :+

JMP \$97C5

: JMP \$801B

For Player Juice Level making %:

LDA \$3D ; Random Number - \$3B or \$3C also would work

AND #\\$0F ; Range of 0-15

CMP \$DE ; Player Juice Level

BCC :+

JMP \$97C5

: JMP \$801B

Quote

Would anything less change the coverage or does it have to be EA? thanks

Is there anyway to have a variable coverage for the COM defense or does it have to be soft/max coverage? Has anyone tried this for any of the sega tecmos?

I have a hack for the SNES that does this, uses a probability to determine if the coverage should be soft or heavy...

Because I needed this for something, I had to have jstout reclarify some points on how this worked for the NES. So, in the process, he converted these to hex for me. I thought I'd share here for anyone who wants them:

NES Late Season COM Coverage:

Members  
+ 102  
2,947 posts

Straight %

SET(0x028B3F, 0xa53dc9**80**90034cc5974c1b80)

where you can modify x80 to be anything from x00 to xFF. x80 is a 50% chance of tough coverage. The lower the number, the more probable it is that the coverage will be tougher...

Player juice making %

This was explained to me like this..."The play code for a LB might be Cover TE 07, Cover FB 04, Stand. For the original if the team juice is more than 07 then he will cover LB, if not then if more than 4 cover FB, else stand" The way I understand it, this patch uses the juice for the player (not the team as in original) from the play chosen and compared to a random number 0-15. If I'm not mistaken, this has a similar effect as the random number patch above but just calculates it in a different way depending on the play called...

SET(0x028B3F, 0xa53d290fc5de90034cc5974c1b80)

I tried this hack on the repo ROM and for whatever reason, it freezes my powerpak when the CPU is on offense. I picked GB vs. Atlanta, and whenever the CPU handed the ball off, the game borked up. I'm hoping jstout can look into it, I sent him the files...

yeah, it might be because the defensive and offensive plays are in two different spots, because the 4-3 hack requires that they are. maybe the mojo doesn't get linked right?

which leads me to a good point, has anyone actually played a full season on the TBorg 2015 rom (or any 4-3 defense rom) yet? who knows, maybe the 4-3 defense rom always shits the bed when the mojo is supposed to kick in...

just brainstorming.

I love the rest of the repo rom so if it was same except for the 4-3 hack removed, is be grateful for that.

4-3 strays too far from the original game imho, and it makes tsbtool not work so you can't tweak it.

Also agree on the 4-3 hack. I don't like it primarily because the o-line blocking schemes are flawed against it.

I've been using the 4-3 hack on my custom ROMs since it was introduced. Coupled with late season coverage hack. Played through several seasons with it, and I would not go back to just 3-4, even though playbook editing get a bit more complicated.

Slightly off-topic, how do you edit the game without TSBTool Supreme? Unless, the repo ROM has other stuff in it that's throwing it off and the coverage hack isn't causing the issue...

See the problem now....the service routine right before this hack branches to a bad opcode when you add this hack as its off by one byte when this hack is applied. The original branch...branched to \$8B39 But as you can see below our jump command is at \$8B38. So we are branching to a bad opcode (0x1B) instead of the start of the jump command 4C 1B 80.

AT (0x28B3E) just change 0A to 09. Problem solved.

Woops, you had my test value (x10) in there. Just to be clear for anyone following:

Original hack by jstout:

**SET(0x028B3F, 0xa53dc9**80**90034cc5974c1b80)**

Brud's updated hack (for 32-team REPO ROM only, I think)

**SET(0x28B3D, 0x9009A53DC9**80**90034CC5974C1B80EA)**

where the red x80 = the value that determines if it's tough coverage or not (lower = tougher coverage more often).

(any idea if removing the 4-3 hack is possible?)

@SBlueman

I just forgot that game is only set up to have one team with boosted values. It could be done but its more complex since the normal rom doesn't really have enough memory to add a second team without moving stuff around. So I'm probably gonna pass on this.

Best we can do would be to edit the defensive reactions for better coverage with the [Play Maker](#) editor and adjusting the pass rush with this great hack:

Sorry, this content is no longer available.

Anyone have any other suggestions for better COM coverage?
